

The dangers of
slippery floors

Dogs' paws slide on smooth surfaces because they're not designed to grip them.

Slipping on flooring will damage the muscles that support the limbs and joints, in dogs of all ages and all sizes!

REHABILITATION

The Pectoral muscles protect and support the front limb joints

The Adductor muscles protect and support the hind limb joints

Injuries and microtraumas to these muscles can progressively impact your dog's joints and mobility. This often leads to increasing levels of pain, discomfort, lameness, and challenging behaviours.

Investing in non slip rugs is a direct investment in your dog's lifelong health and well-being.

Please note: When introducing non-slip rugs, allow your dogs time to adjust to the increased traction, and encourage them to go slower over this new surface.
